Abstract: Rationalize the public health need for exploring non-conventional prophylactic models (e.g., *Genus Epidemicus* (GE) and individualized homeopathy) during acute viral outbreaks when vaccines are absent or delayed.

Objectives: To systematically synthesize clinical trials, prophylactic metrics, and outcome-tracking data regarding individualized and GE homeopathic interventions during outbreaks of influenza-like illnesses (ILI), dengue, and chikungunya.

Methods: Outline the PRISMA-compliant search strategy across databases (PubMed, Scopus, Cochrane, AYUSH Research Portal), inclusion criteria (RCTs, cluster-RCTs, controlled cohort studies, observational prospective tracking), and data extraction metrics.

Results: Summarize the total number of studies evaluated, aggregate population metrics (e.g., large-scale tracking data from India/Cuba), risk reduction percentages, and safety profiling.

Conclusion: Deliver a balanced, objective appraisal of the current evidence base, noting methodological limitations and highlighting translational implications.

Keywords: Homeopathy; Genus Epidemicus; Individualized Homeopathy; Homoeoprophylaxis; Epidemic Management; Viral Outbreaks; Dengue; Chikungunya; Influenza-like Illness; Systematic Review.
