### ABSTRACT:

Patients requiring treatment with custom ocular prosthesis are those who have lost ocular structures through orbital evisceration or orbital enucleation which was necessary as a surgical intervention for a congenital defect, pathology, or an accident. The disfigurement associated with eye loss can cause significant physical and emotional disturbance. As iris placement is a technique sensitive procedure, visual assessment alone may not be accurate. The present article is an illustration of a case report of a lady chosen for a custom ocular prosthesis. An attempt is also made to mimic the shade and colour of the sclera in the wax pattern itself, using white paraffin wax. This gives an accurate registration of the position and alignment of iris disc assembly, giving a natural look.
