**ABSTRACT:**

Missing teeth in the anterior region negatively impacts the patient's appearance and adversely affects the patient's self-confidence. Resin bonded fixed partial denture is a minimally invasive treatment option that can restore function and aesthetics in such patients while also providing a high level of patient satisfaction. Maryland bridges are the resin-retained bridges most commonly used to replace single anterior tooth. This case report demonstrates the management of a single missing tooth in anterior region of upper jaw with Maryland bridge as a treatment modality.

**Keywords:** Maryland bridge, Esthetics, Minimally invasive, Resin bonded.
