### Abstract

For the few remaining teeth patients, overdenture is one of the favoured treatment modality. Through the sensory feedback system of the roots and periodontal ligament, which are maintained under the denture base preserve the alveolar ridge. Retention can be enhanced by various attachments and copings. De Vans golden statement: Perpetual preservation of what remaining is more important than the meticulous replacement, is followed in the tooth supported overdentures.

**Key words: Overdenture, Nylon caps, Custom post patterns**
