ABSTRACT:-

Satisfactory rehabilitation in a patient with a partially edentulous arches can be challenging especially when unilateral or bilateral anterior and posterior segment of teeth is missing. Various conventional and contemporary treatment options can be used to render successful treatment outcomes. An attachment-retained cast partial denture is one such promising treatment modality in long span edentulous arches. This paper describes a case report of a patient with maxillary and mandibular Kennedys class IV edentulous long span restored with a cast partial denture having an extracoronal castable precision attachment (RHEIN 83 OT CAP attachments system).
