**Abstract:**

The management of highly resorbed ridge has always posed a challenge to the prosthodontist for years due to reduction in denture bearing area. Retention is compromised due to poor denture base foundation, so the role of stability becomes even more important, which is achieved by cocktail impression technique and neutral zone. This article outlines the management of the mandibular ridge resorption with the amalgamation of various impression techniques i.e, Cocktail impression technique and neutral zone technique followed by monoplane teeth arrangement.

**Keywords:** Cocktail, neutral zone, monoplane teeth arrangement
