**Abstract**

At present, implant supported or retained prostheses are considered to be as a first therapeutic alternative for patients. Although the success rate of dental implants is high, still no treatment is without complications; same applies to implants. Implant failure can be due to some factors, i.e. osseointegration loss or due to technical complications. This case report discusses the mechanical failure (implant fracture) of prosthesis, which was being retrieved and following it placement of basal implant in that region.
