Abstract-

The prosthetic management of an edentulous patient has long been a major challenge. Complete maxillary and mandibular dentures have been the traditional standard of care. However, most of the patients report problems adapting to their mandibular denture due to a lack of comfort, retention, stability, support and inability to masticate, With the continued advancements in dental implant therapy, it is becoming increasingly easier for the clinician to provide treatment solutions that can effectively meet functional, economic and social expectations of each individual patient. While implant-supported fixed prosthesis offers many advantages, they are very expensive and not indicated in many conditions. Implant supported removable prosthesis can be a choice of treatment in such cases. This clinical report describes a method to rehabilitate a patient with resorbed mandibular ridge with implant-supported overdenture.

Keywords- Mandibular resorption, Implant, Over denture.
