ABSTRACT

Esthetic or cosmetic dentistry represents a key focus within dental practice, driven by growing patient demand for aesthetic improvements. This demand has spurred the development of various techniques for restoring anterior teeth. Among these, composite resin restorations have emerged as a cornerstone of modern restorative dentistry, celebrated for their minimally invasive approach. Direct composite veneering offers a natural restoration option, preserving more of the tooth's original structure compared to indirect methods. This article showcases a case reports illustrating the successful esthetic rehabilitation of anterior teeth using direct composite veneering.

Keywords: flowable composite, veneering, transparent soft splint, dental esthetic.
