Abstract

Conventional complete denture is the best treatment for edentulous arches. There is resorption of bone in both maxilla and mandible. There is more bone resorption in mandible than maxilla, due to which mandibular dentures loose retention and stability. Neutral zone implies that the forces applied by the muscles are in harmony with the denture, therefore providing the denture optimum stability and retention. This case report discusses the procedure to treat the resorbed mandibular ridge.

Keywords- Neutral zone, mandible, admix, green stick, Impression compound.
