Abstract- Tooth wear is a normal process that happens throughout one's life. Tooth wear can be severe in some circumstances. The majority of patients with significant tooth wear are ignorant of the severity of their condition and the repercussions of delaying treatment. In such circumstances, the clinician's participation is critical for appropriate therapy. For the therapeutic management of patients with tooth wear, it is crucial to consider the extent of tooth wear, the dental and periodontal condition, the vertical dimension of occlusion, the necessity of increasing the vertical dimension, the extent of the increase in the vertical dimension, the etiology of tooth wear, and the patient's habits and expectations. This case report describes the management of worn-out mandibular dentition with PFM prosthesis and maxillary esthetic correction with Direct Composite Veneering.

Keywords- Tooth wear, PFM crowns, Direct composite veneering, vertical dimension.
