Abstract: Trauma, surgical resection of neoplasms, or congenital malformations can lead to a variety of defects. Such defects can result in facial disfigurement and have an impact on the psychological status of the individual. Prosthetic rehabilitation of an orbital defect is challenging and requires a tailored approach in restoring aesthetics. However, when appropriately made it is the finest service that can be rendered to a patient who feels socially secluded because of the facial disfigurement. This case report describes a methodological approach for fabrication of a lively silicone orbital prosthesis.

Keywords: Orbital defect, Silicone prosthesis, Maxillofacial defects, Artificial eye, Mucormycosis.
