Abstract

Rehabilitation of maxillofacial defects has always been a challenge. With fewer surrounding structures to gain support and retention from, the success of these prostheses is questionable. To overcome this lacuna, implants are often placed to improve these prostheses' overall survival and acceptability. Although implants are a top choice of treatment for any dentist for replacing missing teeth, choosing implants for rehabilitating defects present intra-orally as well as extra-orally is an enigma that still needs to unfold. This current review aims to discuss the option of implant placement in detail for both intra-oral and extra-oral defects.

Keywords: Maxillofacial defects, extra-oral defects, intra-oral defects, zygomatic implants, obturators
