ABSTRACT:

- Restoring a patient's lost dental aesthetic look is one of the most important issues of the modern-day dentistry. New therapy methods and instruments are constantly being introduced to the market in order to achieve this. Most dentists favour more conservative and aesthetic procedures, such direct and indirect laminate veneer restorations over full-ceramic crowns, for anterior teeth, where aesthetics are more important. Excellent aesthetics and developments in bonding techniques have made porcelain veneers emerge as the preferred treatment. Clinical success of any procedure is contingent upon correctly diagnosing a patient for whom this treatment is appropriate and carrying out the necessary clinical procedures with success. This case report depicts the use of porcelain laminate veneers using computer-aided design/computer-aided manufacturing (CAD/CAM).

Keywords: Smile designing, Veneers, Laminates, Diastema._
