**ABSTRACT:**

Dental implants have been one of the most remarkable developments of seen in dentistry and has truly revolutionized the management of edentulism. However management of edentulous individuals with atrophic ridges is still a challenge. Augmentation of resorbed ridges have various disadvantages such as increase in cost as well as time required. In such a scenario, evolution of basal implants have enabled management of ridges with poor bone height as well. This article discusses the evolution of basal implants, their advantages, disadvantages as well as ponders the difference between basal implants and conventional implants.

**KEYWORDS:** Basal Implants, Crestal implants, Resorbed ridges.
