ABSTRACT

The term “erectile dysfunction” can mean the mobility to achieve erection, an inconsistent ability to do so, or the ability to achieve only brief erections.

The term “premature ejaculation” can mean the early discharge of semen soon after sexual activity and with minimal penile stimulation.

In this study, the efficacy of X Compound DS capsules in the treatment of erectile dysfunction (ED) and premature ejaculation (PME) has been evaluated. X Compound DS capsules could improve the frequency, quality and sustainability of erection and increase the duration of intercourse by increasing the semen discharge time. There was increased sexual desire in men and readiness to initiate sexual intercourse.
