Oral Pathology Techniques

Dr. Charchit Saini

Email : serviceheb@gmail.com

ABSTRACT:

Oral pathology techniques encompass various methods used to diagnose and treat diseases or conditions affecting the mouth, jaws, and related structures. These techniques include clinical examinations, imaging studies like X-rays and CT scans, biopsies, histopathological analysis, and molecular diagnostic tests. Additionally, advanced techniques such as immunohistochemistry and molecular genetics are employed for precise diagnosis and personalized treatment planning in oral pathology.

Precise techniques depend on the specific condition being investigated, ranging from visual inspection to advanced imaging modalities like CT scans or MRI for comprehensive evaluation. Biopsies, involving tissue sample collection, are often crucial for definitive diagnosis, and these samples may undergo histopathological examination for detailed analysis. Regular screenings and collaboration between oral health professionals contribute to effective oral pathology management.

Keywords: Biopsies, Histopathological, Immunohistochemistry.
